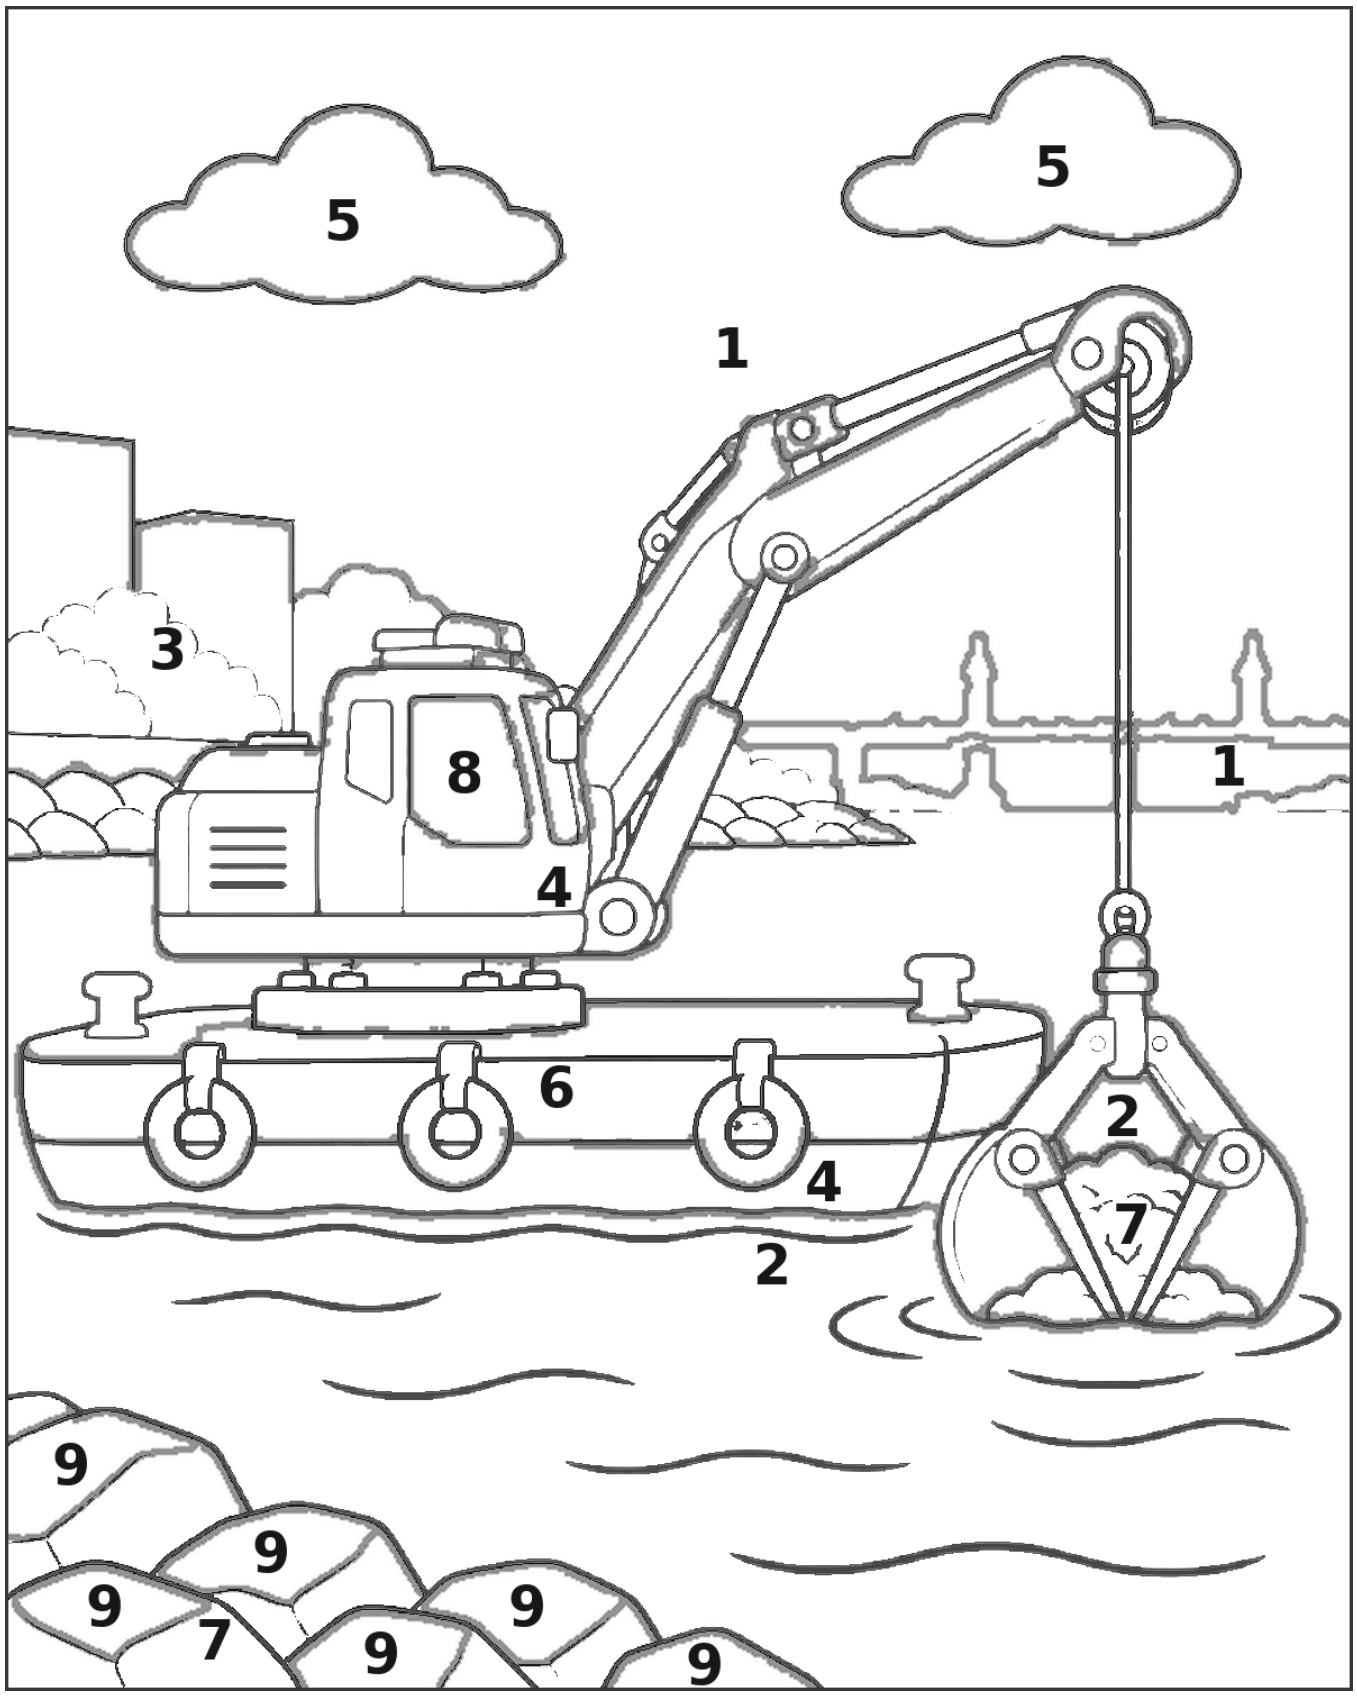
Dredging Barge

How does a bucket pick up mud under water?



1 Peach
2 Lagoon
3 Moss
4 Copper
5 Snow
6 Denim
7 Clay
8 Sky
9 Stone

Did you know? A clamshell bucket has two halves that close around material like a pair of jaws. A crane lowers it, closes it around sediment, and lifts the sediment away. From a floating barge it can reach below the waterline.
